What is this Application?

The **Safety Observation Dashboard** is an enterprise-grade tool designed to help safety managers, supervisors, and teams track, analyze, and improve workplace safety. It transforms raw observation data from Excel spreadsheets into actionable insights through powerful visualizations and analytics.

Key Purpose

Move from **reactive incident response** to **proactive safety culture building** through data-driven decision making.

Who Is It For?

Safety Managers

Monitor overall safety performance, identify trends, and make strategic decisions.

Project Directors

Review project-specific metrics and contractor performance comparisons.

HSE Officers

Track observations, ensure compliance, and manage corrective actions.

Analysts

Deep-dive into data quality, patterns, and predictive insights.

Key Benefits

- ✓ Visualize safety trends at a glance with interactive charts
- ✓ Identify problem areas before incidents occur

- ✓ Track contractor and site performance
- ✓ Ensure data quality with automatic detection of issues
- ✓ Generate reports for management and compliance
- ✓ Predict future trends with built-in forecasting

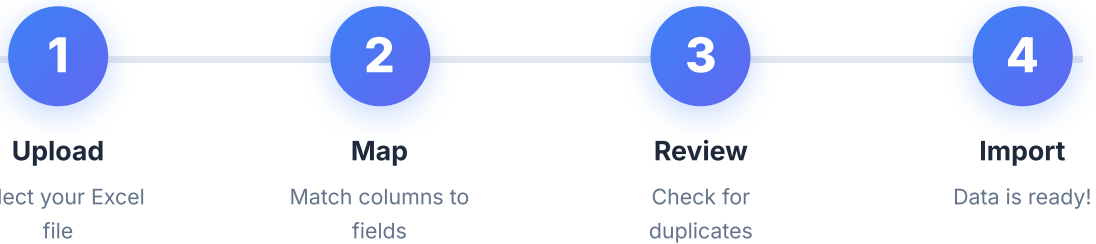

02

Getting Started

Your First Steps with the Dashboard

How Data Gets Into the System

The dashboard works with your existing Excel observation data. Here's the simple process:

Tip: Excel File Requirements

Your Excel file should have columns for: Date, Description, Type (Incident/Near-Miss/etc.), Location/Hazard, Reporter Name, Contractor, Site, and Status.

Navigation Overview

The app has a simple sidebar menu on the left. Here's what each section does:

Menu Item	What It Does
Dashboard	Main overview with KPIs and charts - your starting point
Data Quality	Check and improve the accuracy of your data
Safety Outlook	Analyze hazard trends and root causes
Predictive Analytics	AI-powered forecasts and recommendations
File Manager	Manage your imported Excel files
Import	Upload new observation data

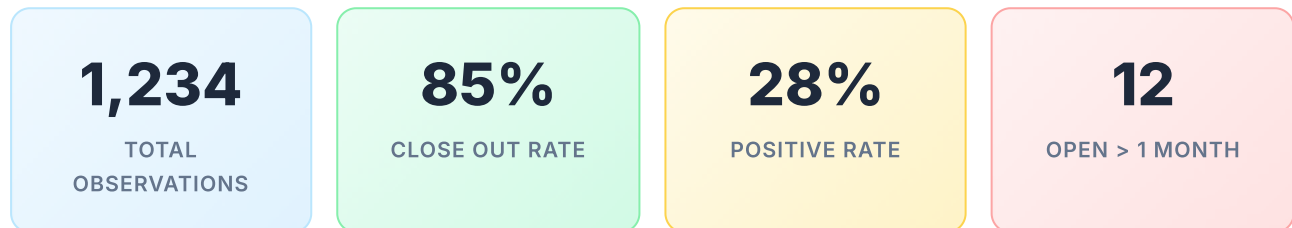

First Things to Do

1. **Import your data** - Go to Import and upload your Excel file

- 2. **Check the Dashboard** - See your safety overview
- 3. **Review Data Quality** - Fix any issues the system detects
- 4. **Explore Trends** - Use Safety Outlook to find patterns

Key Performance Indicators (KPIs)

At the top of the dashboard, you'll see cards showing your most important metrics:

What Each KPI Means

- **Total Observations** - All records imported
- **Close Out Rate** - % of issues resolved (target: 80%+)
- **Positive Rate** - % of proactive observations (target: 30%+)
- **Open > 1 Month** - Overdue items needing attention

Color Coding

- **Green** = Good performance
- **Amber** = Needs attention
- **Red** = Critical issue

The Incident Pyramid

Shows the distribution of observation types following the safety pyramid principle:

Healthy ratios: You want more observations at the bottom (positive, conditions) than at the top (incidents). A tall, narrow top indicates good safety culture.

Charts & Visualizations

12-Month Trend Line

See observation volume over time. Rising line = more reporting activity. Look for spikes that indicate incidents.

Top Hazards

Bar chart of the 10 most reported hazard categories. Focus improvement efforts on the tallest bars.

By Day of Week

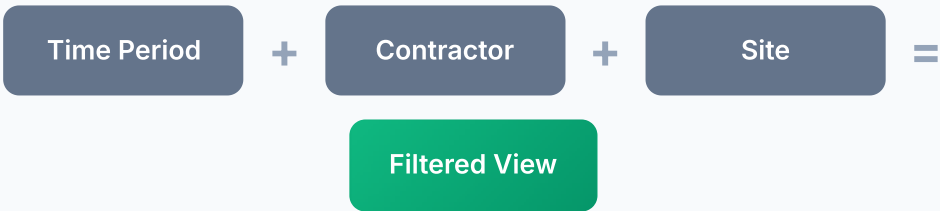

Which days have most observations? Useful for scheduling safety activities.

By Hour of Day

Heatmap showing observation times. Identifies shift patterns and coverage gaps.

Filtering Your View

Use the filter bar at the top to focus on specific data:

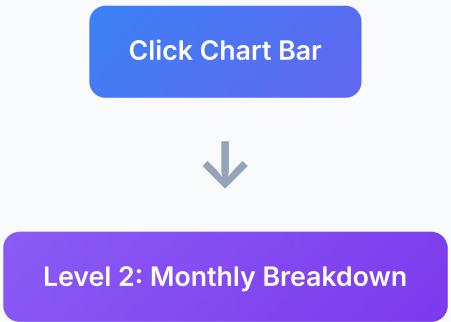

Time periods: All Data | Last Week | Last Month | 3 Months | 6 Months | 1 Year

Drill-Down: Going Deeper

Click on any chart element to see more details. The system supports 3 levels of drill-down:

Drill-Down Navigation Flow

Level 3: All Records for Selection

Click Row: Full Report Details

Navigation Tip

Use the breadcrumbs at the top of the drill-down modal to go back to previous levels, or click outside the modal to close it.

Why Data Quality Matters

Your insights are only as good as your data. The Data Quality page helps you identify and fix issues that could affect your analysis.

Data Quality Score Components

Component	Weight	What It Measures
Categorization	25%	% of records with proper hazard categories
Description Quality	25%	% of records with adequate detail (16-30 words)
Near Miss Rate	20%	Ratio of near-misses to total observations
Coverage	20%	% of days with at least one observation
Reporter Engagement	10%	Diversity of people submitting reports

Issues the System Detects

Missing Categories

Records without a hazard category assigned. Click to review and assign.

Short Descriptions

Vague reports with too few details. Need more context for proper analysis.

Duplicate Records

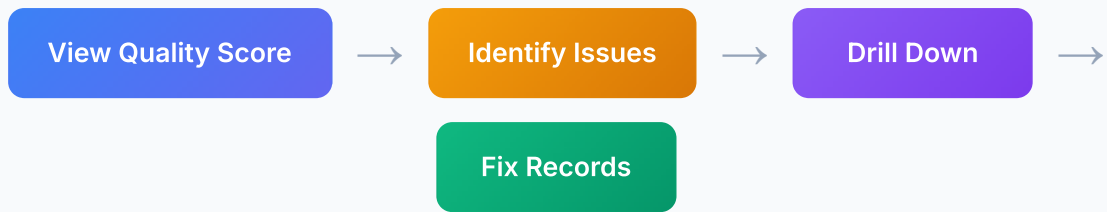

Same observation entered multiple times. Can be merged or deleted.

Spelling Errors

Common misspellings detected. Suggests corrections.

Fixing Data Quality Issues

Quality Improvement Workflow

Each issue card shows a count. Click to drill down into affected records, then update them individually through the report modal.

Two Ways to Analyze

The Safety Outlook page offers two perspectives on your data:

View 1: Hazards

See which hazard types are trending up or down. Helps prioritize where to focus safety efforts.

Rising

Stable

Declining

View 2: Factors

Understand WHY observations are happening. Shows contributing factors like training gaps, PPE issues, etc.

Reading Hazard Trends

Trend Indicators Explained

Indicator	Color	What It Means	Action
Significant Rise	Red	Major increase in observations	Immediate investigation needed
Rising	Amber	Gradual increase	Monitor closely
Stable	Gray	No significant change	Continue current controls
Declining	Green	Decreasing observations	Controls are working!

Contributing Factors

The Factors view extracts common themes from observation descriptions:

- **PPE Issues** - Missing or improper personal protective equipment
- **Training Gaps** - Lack of proper training or certification
- **Communication Failure** - Poor handoff or unclear instructions

- **Housekeeping** - Untidy work areas creating hazards
- **Procedure Violation** - Not following established safety rules

How to Use This

If "Training Gaps" appears frequently for electrical hazards, consider additional electrical safety training. Address the root cause, not just the symptom.

What the System Predicts

Using your historical data, the system can forecast future trends and identify potential issues before they become problems.

30/60/90 Day Forecast

Predicted observation volume for the next 1-3 months based on historical patterns.

Anomaly Detection

Automatically flags unusual spikes or drops that may need investigation.

Risk Score

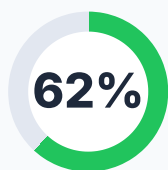

Overall safety risk assessment (0-100%) based on multiple factors.

Recommendations

Prioritized list of suggested actions to improve safety performance.

Understanding the Risk Score

Risk Score Breakdown

Current Risk

Factors included:

- Overdue actions count
- Near-miss reporting rate
- Trend direction (rising/falling)
- Close-out rate
- Reporter engagement

What-If Simulator

Test different scenarios to see how changes would affect your risk score:

Simulation Example

Current: 5 Overdue Actions

Simulate: Close All Overdue

Risk: 62% → 48%

Use this to prioritize actions that will have the biggest impact on safety performance.

File Manager Overview

The File Manager shows all Excel files you've imported, with options to manage them.

File Information Displayed

Field	Description
File Name	Original name of the Excel file
Records	Number of observations from this file
Imported	Date and time the file was uploaded
Size	File size (KB or MB)

Actions You Can Take

Replace File

Upload an updated version of the same file. Old records are removed and replaced with new ones.

Delete File

Remove a file and all its records. Useful for cleaning up test imports.

View Timeline

Visual chart showing when each file was imported and how much data it contains.

Batch Import

Upload multiple files at once to quickly load historical data.

Data Timeline Visualization

The Timeline tab shows your imported files as horizontal bars:

- **Bar length** = Date range of observations in that file

- **Bar color** = Record density (darker = more records per day)
- **Green dot** = When the file was imported

Warning: Deleting Files

When you delete a file, ALL observations from that file are permanently removed. This cannot be undone. Export your data first if you need a backup.

Export Options

Share your safety insights with stakeholders in various formats:

Available Export Formats

PDF Report

PowerPoint

JSON Backup

PDF Export

Creates a multi-page PDF of the entire dashboard, including:

- All KPI cards with current values
- Charts and visualizations
- Current filter settings noted

PowerPoint Export

Generates a presentation with individual slides for:

- Executive summary slide
- Each chart as a separate slide
- Ready for management presentations

JSON Data Backup

Downloads all your data as a JSON file for:

- Backup before making changes
- Migration to another system
- Data analysis in other tools

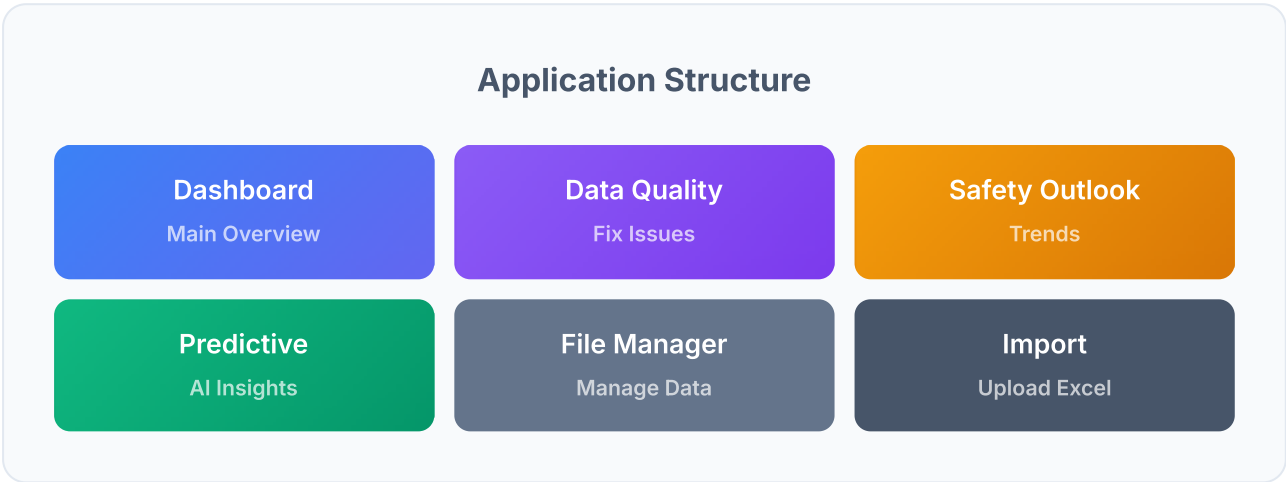

Best Practice

Export a JSON backup regularly (weekly or monthly) to ensure you don't lose data. Store backups in a safe location.

How to Export

1. Go to the **Dashboard** page
2. Click the **Export** button (top right)
3. Choose your format (PDF or PowerPoint)
4. Wait for the file to generate
5. File will automatically download

Navigation Map

Common Tasks

I Want To...	Go To...	Then...
See overall safety status	Dashboard	Review KPI cards at top
Upload new data	Import	Follow the 4-step wizard
Find data problems	Data Quality	Click issue cards to drill down
See what's trending	Safety Outlook	Select Hazards view
Get recommendations	Predictive Analytics	Expand Recommendations section
Delete old data	File Manager	Click trash icon on file row
Export a report	Dashboard	Click Export button
Filter by contractor	Any page	Use filter bar at top

Status Colors

Green = Good / On Target Amber = Warning / Attention Red = Critical / Urgent

Keyboard Shortcuts

Esc	Close any open modal/popup
Click outside modal	Close the modal
Scroll	Navigate long tables and charts

Need Help?
